

## Worksheet II

$$\frac{2}{4} = \frac{3}{6} = \frac{4}{8} = \frac{5}{10}$$

Observe the above ratios

Find the following ratios in simplest form.

1)  $\frac{2+3}{4+6}$

2)  $\frac{2+3+4}{4+6+8}$

3)  $\frac{2+3+4+5}{4+6+8+10}$

From above worksheet and conclusions teacher explains the theorem on equal ratios.

If  $\frac{a}{b} = \frac{c}{d}$  then  $\frac{a}{b} = \frac{c}{d} = \frac{a+c}{b+d} \dots \dots \text{this is the theorem of equal ratios}$

Similarly, If  $\frac{a}{b} = \frac{c}{d} = \frac{e}{f}$  then  $\frac{a}{b} = \frac{c}{d} = \frac{e}{f} = \frac{a+c+e}{b+d+f}$

### Worksheet III

**Make several ratios equal to  $\frac{6}{8}$**

$\frac{6}{8}$	.....	.....	.....	.....	.....	.....	.....
	.....	.....	.....	.....	.....	.....	.....

This can be generalized as,

If  $\frac{a}{b} = \frac{c}{d} = \frac{e}{f} = \dots$ , and if  $l, m, n, \dots$  are non zero numbers

Such that  $lb+md+nf+\dots \neq 0$

Then each ratio =  $\frac{la+mc+ne+\dots}{lb+md+nf+\dots}$
