 Transformations of Functions + the Rational Function $y = \frac{1}{x}$

By: Ing. Ziad Najjar

Name: Erika Escamilla Zecio ID Number: A01520152 Group: unqre

Transformations of Functions

Having a basic function $f(x)$ we define the following translations and reflections (a and K stand for any real number)

$f(x)+k$ is a shift of $f(x)$ by k units upwards

$f(x)-k$ is a shift of $f(x)$ by k units downwards

$f(x+k)$ is a shift of $f(x)$ by k units to the left

$f(x-k)$ is a shift of $f(x)$ by k units to the right

$-f(x)$ is a reflection of $f(x)$ over the x axis

$f(-x)$ is a reflection of $f(x)$ over the y axis

$af(x)$ is a vertical "stretch" of $f(x)$ when $a > 1$

$af(x)$ is a vertical "shrink" of $f(x)$ when $0 < a < 1$

1. Write the function that is obtained by:

a)	Shifting $y = \frac{1}{x}$ upward by 6 units	$y = \frac{1}{x} + 6$
b)	Shifting $y = \frac{1}{x}$ by 1 unit downward and 1 to the left	$y = \frac{1}{x+1} - 1$
c)	Reflection of $y = \frac{1}{x}$ over the x axis and raised by 3	$y = (-\frac{1}{x}) + 3$
d)	Shifting of $y = \frac{1}{x}$ by 5 units to the left and 1 downwards	$\frac{1}{x+5} - 1$
e)	Shifting of $y = \frac{1}{x}$ by 3 units to the right and reflected over the x axis, then shifted by 2 units upwards	$y = -\frac{1}{x-3} + 2$

Algebraic and Transcendental Functions

Identification of linear, quadratic and cubic functions - Self-Study 2

By: Ing. Ziad Najjar

Name: Erika Escamilla Lucio

ID Number: A01570-17 Group:

Linear functions

1. For each of the following representations, write the linear function (in slope intercept form) that corresponds to it.

$$f(x) = \frac{7}{2}x + 7$$

Fill in the missing and figure out equation

x	-2	0	2	3
y	-1	7	15	19

$$Y = 7 + 4x$$

A plumber charges \$170 for showing up for a job (regardless if he does it or not), for every half an hour of work, he charges \$50

a) Write the function that models his income (I) in terms of amount of hours worked (t).

$$I = 170 + 50t$$

b) What would be the plumber's income at a 180-minute lasting job?

$$170 + 50(3)$$

$$170 + 150$$

$$\underline{\$320}$$

$$f(x) = -x + 2$$

Fill in the missing and figure out equation

T(Months)	1	2	3	S
C(Pesos)	3400	3200	3000	2600

$$C = 3600 - 200x$$

Eduardo has \$1,240. He tends to spend his money at a constant rate of \$40 per day.

a) Write the linear function that models the amount of money he has left (M), in terms of days that have passed (t)

$$M = 1240 - 40t$$

b) How many days will pass before he is left with \$720? (write clearly the corresponding equation)

$$1240 - M = 1240 - 40(13)$$

$$1240 - M = 1080$$

$$1240 - 1080 = M$$

$$160 = M$$

The Rational Function $y = \frac{1}{x^2}$

By: Ing. Ziad Najjar

Name: Fikra Escamile Lico ID Number: 101570133 Group: 403

Exploring the function $y = \frac{1}{x^2}$ and its elements

Investigate the graph of the function $y = \frac{1}{x^2}$, and state its characteristics, $\frac{1}{(x+2)^2} + 1$

- a) Domain $\mathbb{R} - \{0\}$ b) Range $(0, \infty)$
- c) Horizontal asymptote 0
- d) Vertical asymptote -2
- e) Increase ✓ f) Decrease ✓

*** To set the domain of any rational function, we exclude the x (s) that make the denominator zero

I. Describe the translation that occurred upon the function $y = \frac{1}{x^2}$

$y = \frac{1}{(x-2)^2}$ is a shift of $\frac{1}{x}$ by 2 units to the right raised by 2
 $y = \frac{1}{(x+1)^2} - 3$ is a Shift of $\frac{1}{x}$ by 1 unit to the right and 3 units down
 $y = -\frac{1}{x^2} + 1 = \frac{-1+x^2}{x^2}$ is a vertical stretch of $y = -\frac{1}{x^2} + 1$ when $-\frac{1}{x^2} + 1 = \frac{-1+x^2}{x^2}$

II. State the domain of the following functions.

Function	$y = \frac{-1}{x-2}$	$y = \frac{1}{(x+2)^2} + 5$	$y = \frac{3}{4-x}$	$y = -\frac{1}{x} + 5$	$y = \frac{4}{(x-7)^2} + 1$
Domain	<u>$\mathbb{R} - \{2\}$</u>	<u>$\mathbb{R} - \{-2\}$</u>	<u>$\mathbb{R} - \{4\}$</u>	<u>$\mathbb{R} - \{0\}$</u>	<u>$\mathbb{R} - \{7\}$</u>

Rational Functions- Horizontal & Vertical Asymptotes

By: Ing. Ziad Najjar

Name: Erika Escamilla Ac. O ID Number: A01572437 Group: 4.03

Vertical and Horizontal Asymptotes of Rational Functions

A function $f(x)$ is said to be a rational function if it is of the form $f(x) = \frac{N(x)}{D(x)} = \frac{a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0}{b_m x^m + b_{m-1} x^{m-1} + \dots + b_1 x + b_0}$, where $N(x)$ and $D(x)$ have no common factors.

The vertical asymptote of $f(x)$ is to be found at the zero(s) of $D(x)$, in other words at the $x(s)$ that make the denominator zero

The horizontal asymptote is found by analyzing the degree of $N(x)$ and $D(x)$, n and m respectively

- a) If $n < m$, the horizontal asymptote is located at $y=0$
- b) If $n = m$, the horizontal asymptote of $f(x)$ is located at $y =$ the ratio of the leading coefficients, meaning $y = \frac{a_n}{b_m}$
- c) If $n > m$, then $f(x)$ has NO horizontal asymptotes

I. State the domain of the following rational functions.

Function	$f(x) = \frac{2x}{x-3}$	$f(x) = \frac{5}{x+1}$	$f(x) = \frac{4x+1}{x^2-9}$	$f(x) = \frac{2x^2-3}{5-x}$
Domain	$D: \mathbb{R} - \{3\}$	$D: \mathbb{R} - \{-1\}$	$D: \mathbb{R} - \{-3, 3\}$	$D: \mathbb{R} - \{5\}$
Function	$y = \frac{2x^2+x^2}{3x-4}$	$y = \frac{x-3}{x^2+16}$	$y = \frac{x+1}{3x-6}$	$y = \frac{x+1}{x^2-3}$
Domain	$D: \mathbb{R} - \{4/3\}$	$D: \mathbb{R} - \{-4, 4\}$	$D: \mathbb{R} - \{2\}$	$D: \mathbb{R} - \{0, 3\}$
Function	$y = \frac{6x}{x^2+5x-6}$	$y = \frac{3+x}{x^2+2x}$	$y = \frac{x^2-2}{x^2-2x^2-3x}$	$y = \frac{x-1}{x^2-8}$
Domain	$D: \mathbb{R} - \{6, -2\}$	$D: \mathbb{R} - \{0, -2\}$	$D: \mathbb{R} - \{0, 3, -3\}$	$D: \mathbb{R} - \{2\}$

$(x+6)(x-2)$ $x(x+2)$ $x(x^2-2x-3)$

Algebraic and transcendental functions - Quiz 1 - Partial 1

Name: Erika Escamilla Ac. O ID: A01572437

Solve the following problems showing a clear procedure (20 points each).

1. Consider the function $f(x) = x^2 - 5x + 3$, find the following (write simplified answers):

a) $f(3) = -3$

b) $f(-2) = 17$

c) $f(x+h) = x^2 + 2xh - 4h - 5x + 3$

d) $\frac{f(x+h)-f(x)}{h} = 1$

-2 \times

2. Let $f(x) = \sqrt{1-x^2}$ and $g(x) = 1+x$ be two functions, find the following (simplify your answers):

a) $f \circ g(x) = \sqrt{2+2x+x^2}$

b) $g \circ f(x) = 2-x$

c) $f \circ f(x) = \sqrt{1-\sqrt{1-x^2}}$

d) $g \circ g(3) = 2+x$
